

Connecticut – Regional SWD Update 2014

SWD IPM Working Group

Highland, NY

16 September 2014

SWD traps were set out in May with nothing until July. By late July numbers were fairly high. I stopped trapping and relied on trap counts from Rich Cowles, Connecticut Agricultural Experiment Station, for grower emails. By late July – early August blueberries and brambles were being sprayed.

Trap crop research project begun this fall with fall brambles (Polana and Caroline) surrounding everbearing strawberries (Seascape). Grower spraying brambles only. No differences in check and treatment strawberries as of 9/14/14.
